                                                                                                                                                                                                This sequence represents an unmethylated CpG dinucleotide, and can be CC used in the method of the invention. The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one CC unmethylated CpG. The nucleic acids containing an unmethylated CpG CC unmethylated CpG. The nucleic acids containing an unmethylated CpG CC to a Thire cells (NK) or redirecting a subject simmune response from a Th2 CC to a Thiresponse by inducing monocytic and other cells to produce Th1 CC cytokines. They can be used to treat pulmonary disorders having an CC immunologic component, such as asthma or environmentally induced alrway CC disease. They can also be used to treat pulmonary disorders with Gram-CC meningitis, neonatel sepsis, cystic fibrosis, inflammatory bowel disease C meningitis, neonatel sepsis, cystic fibrosis, inflammatory bowel disease C and liver cirrhosis, Gram-negative phaeumonia, Gram-negative abdominal CC abscess, haemorrhagic shock, disseminated intravascular coagulation, or CC an inflammatory response to lipopolysaccharide

or autoimmune New immunostimulatory nucleic acid molecules - which contain at least one unmethylated CpG dinucleotide, used for treating e.g. tumours, infections disease.

Disclosure; Page 49; 109pp; English

AAV27641-751 represent immunostimulatory oligodeoxyribonucleotides (ODNs) of the invention. The ODNs contain at least one unmethylated CpG dinucleotide, and have the formula: 5' NIXIGGX2N2 3', where at least one nucleotide separates consecutive CpGs, X1 is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer

Use of nucleic acids containing an unmethylated CpG - 1 subject having or at risk of having an acute decrement inhibiting an inflammatory response.

t in

treating air flow

The CDNs activate lymphocytes in a subject and redirect a subject's immune response from a Th2 to a Th1 (e.g. by inducing monocytic cells and other cells to produce Th1 cytokines, including IL-12, IFN-gamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic disorder, autoimmune diseases, in desensitisation therapy, as an artificial adjuvant during antibody generation in a mammal such as a mouse or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ41906 standard;

subject comprising administering to a subject exposed to an antigen, an immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide to induce a synergistic antigen specific immune response. The methods are useful for treating cancer by stimulating an antigen specific immune response against a cancer antigen. The methods can also be used to treat neoplastic disorders in humans, including but not limited to: sarcoma, neoplastic disorders in humans, including but not limited to: sarcoma,

carcinoma, fibroma, Lymphoma, melanoma, and glioma. The methods are also useful

neuroblastoma, retinoblastoma,

The present invention describes a method using CpG containing oligonucleotides (ONs) for regulating immune system remodeling and for regulating haematopoiesis. The method for inducing an antigen-specific immune response comprises: (1) administering an ON having a sequence including at least the formula (I); and (2) exposing the subject to an antigen specific immune response: 5' XIGGX 3' (I), where the ON = includes at least 8 nucleotides; C and G = unmethylated, and X1 and X2 = nucleotides. The method can be used using the subject to an antigen-specific immune response: 5' XIGGX 3' (I), where the ON = includes at least 8 nucleotides; C and G = unmethylated, and X1 and X2 = nucleotides. The method can be used.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               methods and compositions may also be applied to treat cancer and tumours in non human subjects, e.g. cats and dogs. Neoplasias affecting agricultural livestock may also be treated and include leukaemia, haemangiopericytoma and bovine ocular neoplasia. Chronic, infectious, contagious diseases of sheep and goats caused by the bacterium Corynebacterium pseudotuberculosis, and contagious lung tumour of sheep caused by jaagsiekte may also be treated. CpG oligonucleotides can be useful in activating B cells, NK cells, and antigen presenting cells, such as monocytes and macrophages. CpG oligonucleotides enhance antibody dependent cellular cytotoxicity and can be used as an adjuvant in conjunction with tumour antigens to protect against a tumour challenge

It can be used in a subject at risk of developing cancer or an allergic reaction. It can also be used for treating an infectious disease, allergic diseases and asthma, as well as thrombocytopaenia which is drug-induced, due to an autoimmune disorder such as idiopathic thrombocytopenic purpura, or resulting from accidental or therapeutic radiation exposure. It can also be used for treating anaemia such as drug cinduced anaemia, immunohaemolytic disorder, genetic disorders such as companied anaemia, indequate production despite adequate iron stores, chronic disease such as kidney failure, and chronic inflammatory disorder such as sheamatoid arthritis, or anaemia cresulting from accidental or therapeutic radiation exposure. AAZ47932 to AAZ48029 represent phosphorothioate CpG oligonucleotides used in the creamplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

   The present invention describes a method for treating and preventing parastic infection by administration of unmethylated CpG oligonucleotides. The CpG oligonucleotides are able to stimulate the innate immune system via the activation of immune cells, such as antige presenting cells, natural killer cells and granulocytes. The CpG oligonucleotides and the method can be used to treat and prevent parastic diseases, such as malaria, helminth diseases, tick and mites humans, animals and poultry. The oligonucleotides may be administered in conjunction with parasiticides or other therapeutic compounds after an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (IOWA ) UNIV IOWA RES POUND

Diseases which can be treated or prevented include those caused by Plasmodium falciparum, P. ovale, P. malariae, P. vivax, P. knowlesi, Babesia microti, B. divergens, Trypanosoma cruzi, T. gambiense, T. rhodesiense, Schistosoma mansoni, Toxoplasma gondii, Trichinella spiralis, Leishmania major, L. donovani, L. braziliensis, and L. tropica. The parasite is especially capable of causing malaria. The present sequence represents a parasitic infection preventing exemplary oligonucleotide sequence from
The present invention describes methods for inducing interleukin 6 (II-6), interferon-gamma (IFN-gamma) or II-12, or for stimulating natural killer cell lytic activity. The methods comprise administering to the subject or exposing a natural killer cell to an immunostimulatory nucleic acid. Also described are: (1) inducing II-6 in a subject comprising administering to the subject to induce II-6 in the subject the immunostimulatory nucleic acid; (2) stimulating natural killer cell lytic activity comprising exposing a natural killer cell to the immunostimulatory nucleic acid to stimulate natural killer cell lytic activity; (3) inducing interferon-gamma in a subject to treat an immune system deficiency comprising administering to the subject to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 18 BP; 2 A; 8 C; 4 G; 4 T; 0 U; 0 Other;

The methods are useful for inducing II-6, interferon-gamma or II-12, or stimulating natural killer cell lytic activity in a subject, particularly a human. The methods are particularly useful for modulating an immune response. AAH50571 to AAH50571 to particularly oligonucleotide sequences used in the exemplification of the present
                                 immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or also useful for preventing cancer, asthma, infectious disease, allergy or
                                                                                                                                                                                                                                                                                     The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory in acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccinating against tumors, infectious using immunostimulatory Py-rich and TG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2001-273485/28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Krieg AM,

                                    response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or is staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the

                                                                                                                                                                                                                                                                       administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; ediabetuar glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting angiogenesis in a subject, involves administering at least antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to inhibiting angiogenesis in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-DEC-2000; 2000US-025534P

                                                                                                                                                                                                                                                                                                                                                                            The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telanglectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and TIRB polypeptides. These polypeptides comprise fully defined
cequences of 1032, 1050 or 1032 amino acids as given in specification, or
their fragments, where TIRP, TIRP, and TIRB polypeptides or their
certagments have an amino acid sequence which is identical to human TIRP,
certagments have an amino acid sequence which is identical to human TIRP,
certagment cand of a murine TIR polypeptide. The isolated nucleic acids of the
acid of a murine TIR polypeptide. The isolated nucleic acids of the
certagment on are useful for inhibiting TIRP signalling activity in a cell.
certagment of TIRP polypeptides are useful for identifying nucleic acid
certagment. The polypeptides are also useful for identifying ISNA. The
certagment TIRP polypeptides are also useful for comparing TIRP,
certagment TIRP polypeptides are also useful for comparing TIRP,
certagment TIRP polypeptides are also useful for compounds) with
certagment TIRP, TIRB and TIRP polypeptides are also useful for
constantifying species specificity of an ISNA. The isolated nucleic acids of
continuous the titre to the invention are useful as probes or primers. This polypuclectide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC This invention relates to a novel method for activating or causing CC maturation of a dendritic cell. The method comprises contacting a CC dendritic cell with an isolated nucleic acid containing at least one CC unmethylated CpG dinucleotide in an amount effective to activate or cause CC vivo. The method of the invention may have cytostatic or antiallergic CC activities. The method of the invention is useful for cancer CC immunotherapy or for treating an infectious disease or allergy, by CC administering an activated dendritic cell that express a specific cancer, CC microbial or allergy causing antigen, to a subject having a cancer concident of the allergy causing antigen or to a subject having an activated concident of the allergy causing antigen or to a subject having an activated concident of the allergy causing antigen or to a subject having an activated concident of the allergy causing antigen or to a subject having an activated concident of the allergy causing antigen or to a subject having an infection with a cc allergic reaction to the allergy causing antigen or to a subject having an infection with a cc allergic reaction to the allergy causing antigen of the invention. The method concident coll is prepared using the method of the invention. The method collective to activate the dendritic call is 8-80 bases in length in an amount effective to activate the dendritic call is 8-80 bases in length in an amount concident colls from the subject. The use of CpG allows the generation of concident colls from the subject of concident colls and isolating collective to activate the dendritic call is 8-80 bases in length in an amount collective to activate the dendritic call is 8-80 bases in length in an amount collective to activate the dendritic call is 8-80 bases in length in an amount collective to activate the dendritic calls to a subject, and isolating collective to activate to subject. The use of CpG allows the generation of concident and collective to activate to subject to subject to the allows the subjec

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of treating non-allergic inflammatc disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating non-allergic inflammatory diseases, such as psoriasis, allergic contact dermatitis, latex dermatitis or inflammatory b disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        04-DEC-2003

                                                                                                                                                                                                                                                                                                                  The invention relates to a method of activating a dendritic cell. The method involves contacting the dendritic cell with an isolated nucleic acid containing at least one unmethylated CpG dinucleotide, where the nucleic acid is about 8-80 bases in length, in an amount that activates the dendritic cell. The compositions and methods of the invention are
                                                                                                                                                                                                                                                                                                                                                                                                                            Activating a dendritic cell useful for treating cancer, infectious diseases or allergies, comprises contacting the dendritic cell with an amount of an isolated nucleic acid that contains at least one unmethylated CpG dinucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Unidentified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide 1761

                                                                                                                                                                    cc unmethylated CpG dinucleotide. The invention also relates to methods of control of the unit of the stimulating immune activation in a subject, where the stimulation is compensating a mucleic acid sequence of the invention, comprising control of the nucleic acid sequence acts as an adjuvant, a method of stimulating cytokine production in a subject comprising administering a nucleic acid sequence, a method of stimulating MK lytic activity in a converse of the invention, or optionally, where the nucleic acid sequence, a method of stimulating MK lytic activity in a subject comprising administering a nucleic acid sequence, a method of stimulating B-cell proliferation in a subject comprising administering a nucleic acid sequence, a method for treating a subject having an activity in a stimulating B-cell proliferation in a subject comprising administering an control of anticimulation of the control of a stimulating the control of a method for treating a subject having an activitical carrier, and a method for treating a subject having an autoimmune or other CpG-associated disorder by inhibiting CpG-mediated cardification in a pharmaceutical carrier. The methods are useful in correventing or treating autoimmune or other CpG-associated disorders, such as systemic lupus erythematosus, sepsis, inflammatory bowel disease, career or infections (e.g. viral, fungal, bacterial or parasitic infections). This sequence represents an oligonucleotide containing an unmethylated CpG dinucleotide, used in the scope of the invention.
                                                                                                                                           Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid sequence containing at least one unmethylated CpG dinucleotide, useful for preventing or treating autoimmune or other CpG-associated disorders, e.g. sepsis, arthritis, Grave's disease, asthm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Krieg

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   screening for species specificity of an immunostimulatory compound. Sequences ACF36744-ACF36822 represent exemplary immunostimulatory oligonucleotides which may be used to stimulate TLR3 signalling act
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for identifying an immunostimulatory compound which comprises contacting a functional Toll-like receptor 3 (TIR3) with a test compound, and detecting a test response mediated by the TIR3 signal transduction pathway. A test compound is deemed to be immunostimulatory when the test response exceeds the negative control sequence, or equals or exceeds the reference response. The method is useful for identifying compounds that modulate TIR3 signalling activity, particularly immunostimulatory compounds. The method may also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying an immunostimulatory compound by contacting a functional Toll -like receptor (TLR) 3 with a test compound, and detecting a test response mediated by the TLR3 signal transduction pathway.
                                                                                                                                                                                                                                ADI01100;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antiparasitic and antisthmatic activities and may be useful for treating or preventing cancer, including brain, lung, ovary, breast, prostate and colon cancers, as well as leukaemia, carcinoma, sarcoma and tumour. Furthermore, the method may be utilised to address viral, fungal, bacterial or parasitic infection and asthmatic disorders. The current sequence is that of the immunostimulatory CpG (unmethylated cytosine-guanine)-related oligodeoxynucleotide (ODN) of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an isolated nucleic acid sequence containing at least one unmethylated CpG dinuclectide. The nucleic acid is useful for treating an asthmatic disorder, and may also be used for treating cancer, viral, fungal, bacterial, or parasitic infections. The nucleic acid may also be used for treating allergies, and as a synthetic adjuvant. Administration of an inhibitor of endosomal acidification is useful for treating autoimmune or other CpG associated disorders, such as systemic lupus crythematosus, sepsis, inflammatory bowel disease, psoriasis, giggingivitis, arthritis, Crohn's disease, Grave's disease and asthma.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to oligonucleotide sequences containing at least one unmethylated CpG dinucleotide that are able of modulating an immune response such as stimulating Thelper cell (Th) pattern of immune activation, cytokine production, natural killer cell (NK) lytic activity, and B cell proliferation in subject, preferably human. The immunostimulatory oligonucleotides of the invention are useful for treating asthmatic disorders, autoimmune or other CpG associated disorders (e.g. systemic lupus erythematosus, sepsis, inflammatory bowel disease, psoriasis, gingivitis, arthritis, Crohn's disease, Grave's disease, cancer, and viral, fungal, bacterial, and parasitic diseases. The present sequence represents an unmethylated CpG dinucleotide colligonucleotide that is tested for its ability to modulate an immune

The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and stopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the

The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral
Oligonucleic acid-bearing composite, useful for treating cancer, comprises cationic liposome composed of 2-0-(2-diethylaminoethyl)carbamcyl-1,3-0-diolecylglycerol and phospholi active ingredient with oligonucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              interfering RNA), shrNA, antisense DNA, antisense RNA, DNA enzyme, cribozyme or an aptamer. The oligo double-stranded RNA comprises an entisense and sense RNA strand with 2 DNA bases at the 3' terminal ends. The oligonucleic acid-bearing composite is delivered into a cell containing a target molecule (e.g. target DNA, RNA or protein). The containing a target molecule (e.g. target DNA, RNA or protein). The containing a target molecule (e.g. target DNA, RNA or protein). The containing a target molecule (e.g. target DNA, RNA or protein). The containing a target molecule (e.g. target DNA, RNA or protein). The containing a target molecule of the oligonuclectide includes a viral gene of HIV, composition for transition related gene such as Dcl-2, composite (tumor necrosis factor alpha) and Fas gene, their transcription product, compositation product, and the non-coding region of genomic DNA of arbitrary protein. The oligonucleic acid-bearing composite is useful for preparing a pharmaceutical composition for treating or preventing diseases such as concern, viral disease or inflammatory disease. The oligonucleic acid enables efficient biological activity with respect to the target molecule (e.g. target DNA, RNA or protein). This sequence represents the reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    target DNA, target RNA or target protein. The oligonucleic acid-bearing composite has an average particle diameter of 10-100 nm. In the preferred oligonucleic acid-bearing composite the phospholipid is lecithin, the oligonucleotide is RNA, DNA or its derivative, preferably siRNA (short
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disclosed is a pharmaceutical composition for preventing and/or treating disease, comprising the oligonucleic acid-bearing composite, where the target molecule for the oligonucleic acid-bearing composite, includes the composite of the oligonucleic acid-bearing composite, includes the composite of the oligonucleic acid-bearing composite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleic acid-bearing composite comprising a cationic liposome composed of 2-O-(2-diethylaminoethyl)carbamoyl-1,3-O-dioleoylglycerol and phospholipid as an active incredient, with the oligonucleic acid having 10-15 bases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a composition for modulating and/or stimulating the immune system of an animal, comprising bacterial oligoribonucleotides (ORN) with a molecular weight of less than 10 kD. The bacterial ORNs are preferably ADW79934-ADW79936, contain CpG motifs and are resistant to RNase. Bacteria produce RNAse-resistant CpG ORNs in response to stresses such as a change in environment, including the neutral pH they encounter when they colonize animals. The immune systems of animals have co-evolved when they colonize animals. The immune systems of animals have co-evolved to recognize such CpG ORNs as being derived from bacteria, and has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition for modulating and/or stimulating immune system of animal useful for withstanding microbial infections and lethality of endotoxic shock, comprises low molecular weight oligoribonucleotide from bacteria.
                                                 CpG ODN1761,

response from antibody (humoral) immune response (Th2) to cellular immune response (Th1) thus acting as immune subject compounds. The invention is useful for treating, preventing or ameliorating a papilloma virus infection, autoimmune disorders (particularly systemic lupus) and other disorders such as tumor or cancer, viral, crythematosus) and other disorders such as tumor or cancer, viral, crythematosus) and other disorders such as tumor or cancer, viral, creation and leukemia and for stimulating immune activation. The nucleic acid sequences of the invention are useful as an adjuvant for generating antibodies and in the production of vaccines. The invention is also useful in immunotherapy. The present sequence is a CpG oligonucleotide involved in induction of natural killer (NK) cell lytic activity. Note: The present sequence is the SEQ ID NO: 60 which is given in the sequence listing. This sequence differs from the SEQ ID NO: 60 shown in the cdisclosure (page 19) of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating, preventing or ameliorating a papilloma virus infection comprises administering to the subject a composition containing

                                                                                                                                                     The present invention relates to nucleic acid sequences containing at least one unmethylated CpG dinucleotide which are immunostimulatory. The invention also provides a method for desensitizing a subject against the occurrence of an allergic reaction in response to contact with an allergen. The method involves administering to a subject an amount for desensitizing the subject against the occurrence of an allergic reaction of an immunostimulatory nucleic acid. The invention is useful for treating or preventing allergy and allergic conditions selected from eczema, allergic rhinitis, allergic coryza, hay fever, urricaria and food allergy. The invention is also useful for treating autoimmune disorder particularly systemic lupus erythematosus and other disorders, e.g. tumor or cancer, viral, bacterial, fungal, or parastic infection, asthmatic
                                                                                                        disorder, or leukemia in a subject and for producing vaccine. sequence is a CpG immunostimulatory phosphorothicate modified oligodeoxynucleotide (S-ODN).
                                                                                                                                                                                                                                                                                                                  Disclosure; SEQ ID NO 60; 72pp; English

The oligonucleotide is useful for stimulating an immune response including a Th1 pattern of immune activation, cytokine production, NK lytic activity and B cell proliferation, in a subject having cancer or an infectious disease. The invention is also useful as synthetic adjuvant and in immunotherapy. The present sequence is a CpG oligonucleotide involved in the induction of NK lytic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide, useful for stimulating an immune response a Th1 pattern of immune activation, cytokine production, NK lytactivity and B cell proliferation, in a subject having cancer cativity and B cell proliferation, in a subject having cancer cativity.

Also included are: (1) inhibiting the growth of cancer cells in vitro, which comprises contacting the cancer cells with a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; (2) treating or preventing cancer in a human, which comprises administering a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; and (3) a pharmaceutical composition comprising a hybrid oligomer or a bcl-2 antisense oligomer and a carrier. The pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer, hyperplasia or tumourigenesis and also bacterial infection, viral

The oligonucleotides are phosphodiesters targeted against the translation initiation site (AAQ86650-55) or the 5'-cap region (AAQ86656-58) of human bcl-2 pre-mRNAs. The AAQ86651 oligonucleotide provided pronounced DNA fragmentation. (Updated on 25-MAR-2003 to correct PN field.)

The pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer,
                                                                                                                                                                                                                                             Antisense oligonucleotide; B cell cancer; lymphoma; leukemia; chemot autoimmune disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         insperplasia or tumourigenesis and also bacterial infection, viral infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and bcl-2 antisense oligomer are also useful for preventing or treating because in the virus infection. The hybrid oligomers can also be used for screening candidate transcription factors or other molecules e.g., gene regulatory proteins or for diagnostic assays. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hybrid oligomer comprises a cyclic AMP response element sequence and a sequence that hybridizes to the bcl-2 pre-mRNA or mRNA useful for preventing or treating cell-proliferative disorders e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a hybrid oligomer comprising a cyclic AMP response element (CRE) sequence and a sequence that hybridises to the bcl
                                                                                                                     28-NOV-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   complementary to B cell lymphoma/leukemia-2 (bcl-2) mRNA. The antisense oligonucleotide is useful for inhibiting cancer cell (lymphoma or leukemia cells) growth, for increasing the sensitivity of cancer cells to cancer chemotherapeutic agents, or for inducing cancer cell death alone or in combination with any one or more cancer chemotherapeutic agents. It is also useful for reducing the bcl-2 gene expression or impairing bcl-2 protein function, for ex vivo bone marrow purging, for removing residual malignant cells from the bone marrow, for inhibiting cancer of neoplastic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense oligonucleotide complementary to B cell lymphoma/leukemia -2 mRNA, useful for inhibiting cancer cell growth, for treating autoimmune disorders, and for ex vivo bone marrow purging.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in significant therapeutic responses, including low toxicity, high to tolerance and prolonged survival. Administration at high doses for short periods of time (less than 14 days) also provides significant therapeutic responses in the treatment of cancer. The bol-2 antisense oligomer may also be used to increase the sensitivity of a subject to cancer therapeutics, and in combination with hormone treatment or gene therapy. Conditions that may be treated or prevented include cancer of the chematopoietic system, skin, bone and soft tissue, reproductive system, genitourinary system, breast, endocrine system, brain, central nervous system, peripheral nervous system, kidney, lung, respiratory system, contractive system, peripheral nervous system, kidney, lung, respiratory system, contractive system, peripheral nervous system, kidney, lung, respiratory system, contractive system, peripheral nervous system, kidney, lung, respiratory system, contractive system, peripheral nervous system, kidney, lung, respiratory system, contractive system, peripheral nervous system, kidney, lung, respiratory system, contractive system, kidney, lung, respiratory system, contractive system, contractive system, kidney, lung, respiratory system, contractive system, contractive system, kidney, lung, respiratory system, contractive syst
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The anticode oligomers have cytostatic activity. The oligomers may be used in gene therapy to treat cancer. The method is also useful for increasing the sensitivity of a tumor cell to a chemotherapeutic agent. The types of treatable cancer include non-lodgkin's lymphoma, prostate cancer, breast cancer, gastro-intestinal cancer, or colon cancer. The anticode oligomers are useful for inhibiting growth of cancer cells or killing tumor cells. This polynucleotide sequence represents a bcl-2 oligodeoxynucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                AAV28155-268 represent oligonucleotides which can be purified using the method of the invention. The specification describes a matrix that comprises a support and an affinity unit that specifically and reversibly binds a target oligonucleotide, and comprises a sequence of bases having the reverse complement of a hybridising portion of the target oligonucleotide. The matrix is used for affinity purification of synthetic oligonucleotides, specifically antisense agents, for treatment of hyperproliferative diseases, for treating a non-pathogen, non-hyperproliferative disease, e.g. Alzheimer's, for modulating expression of cell surface proteins, and to inhibit a eukaryotic pathogen,

                                                                                                                                                                                                                                                                                                                                                                                                                                          (i) to treat or prevent any Gibease of Lincoln (ii) to treat or prevent any Gibease, beta-thalassemia, the nucleic acid, e.g. cancer, Alzheimer's disease, beta-thalassemia, malaria, viral infections (including human immune deficiency virus (HIV)), inflammation, in human or animal medicine; (ii) to investigate the role of a gene or gene product in non-human animals; and (iii) to modulate gene expression in cells, tissues or organs. The compositions provide bloavailability of at least 15, preferably 17-35,% The penetration enhancer improves: (i) transport of the nucleic acid across the mucosa of the alimentary canal and into cells; and (ii) increases stability of the nucleic acid. Oral administration avoids the complications and expense of intravenous or other methods of administration. AAX18669 to AAX18799 and AAX18801 represent antisense administration. AAX18669 to AAX18799 and AAX18801 represent antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A pharmaceutical composition has been developed which comprises a nucleic acid and at least one penetration enhancer. The compositions are used:
(i) to treat or prevent any disease or disorder that can be treated with the nucleic acid, e.g. cancer, Alzheimer's disease, beta-thalassemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition comprising nucleic acid and penetration enhancer - used particularly for delivering therapeutic antisense oligonucleotides across the gastrointestinal mucosa, provides high bloavailability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Teng
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cellular adhesion protein; proliferation; antisense oligonucleotide; alimentary canal; transport; gastrointestinal mucosa; cancer; Alzheimer's disease; beta-thalassemia; malaria; viral infection; HIV;
Deletion sequence oligonucleotide; sensor array; eukaryotic pathogen; probe; cellular adhesion modulator; cellular proliferation modulator;
                                                    Deletion sequence oligonucleotide 137.

administering a hybrid oligomer or a bcl-2 antisense oligomer and a CRB decoy oligomer; and (3) a pharmaceutical composition comprising a hybrid oligomer or a bcl-2 antisense oligomer and a CRB decoy oligomer and a carrier. The pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer, hyperplasia or tumourigenesis and also bacterial infection, viral infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and bcl-2 antisense oligomer are also useful for preventing or treating hepatitis B virus infection. The hybrid oligomers and also be used for
                                                                                                                                                                                                                                                                                                                                response element (CRE) sequence and a sequence that hybridises to the bcl 2 pre-mRNA or mRNA. Also included are: (1) inhibiting the growth of cancer cells in thro, which comprises contacting the cancer cells with a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; (2) treating or preventing cancer in a human, which comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hybrid oligomer comprises a cyclic AMP response element sequence and a sequence that hybridizes to the bcl-2 pre-mRNA or mRNA useful for preventing or treating cell-proliferative disorders e.g., cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          complementary to B cell lymphoma/leukemia-2 (bcl-2) mRNA. The antisense oligonucleotide is useful for inhibiting cancer cell (lymphoma or leukemia cells) growth, for increasing the sensitivity of cancer cells to cancer chemotherapeutic agents, or for inducing cancer cell death alone or in combination with any one or more cancer chemotherapeutic agents. It is also useful for reducing the bcl-2 gene expression or impairing bcl-2 protein function, for ex vivo bone marrow purging, for removing residual malignant cells from the bone marrow, for inhibiting cancer of neoplastic cell growth, and for treating autoimmune disease

CC antiense oligonuclectide. The present invention is directed to the use CC of bcl-2 antisense oligomers, particularly G3139 (see ABL54148), to treat CC and prevent bcl-2 related disorders. Administration at high doses results CC in significant therapeutic responses, including low toxicity, high CC tolerance and prolonged survival. Administration at high doses for short CC periods of time (less than 14 days) also provides significant therapeutic responses in the treatment of cancer. The bcl-2 antisense oligomer may CC also be used to increase the sensitivity of a subject to cancer CC therapeutics, and in combination with hormone treatment or gene therapy. CC conditions that may be treated or prevented include cancer of the CC haematopoietic system, skin, bone and soft tissue, reproductive system, contral nervous system, peripheral nervous system, kidney, lung, respiratory system, contral and alimentary canal, lymph nodes, pancreas, CC thorax, gastrointestinal and alimentary canal, lymph nodes, pancreas, CC hepatobiliary system, or cancer of unknown primary site, non-Hodgkin's CC hepatobiliary system, breast, ovarian, prostate, cervical, testicular, cancer, cancer, renal cell carcinoma, hepatoma, bile duct carcinoma, back or brain cancer, renal cell carcinoma, hepatoma, bile duct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating or preventing cancer, tumors and carcinomas, comprises administering B cell lymphoma/leukemia-2 antisense oligonucleotide at high doses for short period for time with one or more cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pharmaceutical carrier; and increasing the sensitivity of a tumor cell to a chemotherapeutic agent. The anticode oligomers have cytostatic activity. The oligomers may be used in gene therapy to treat cancer. The method is also useful for increasing the sensitivity of a tumor cell to a chemotherapeutic agent. The types of treatable cancer include non-lodgkin's lymphoma, prostate cancer, breast cancer, gastro-intestinal cancer, or colon cancer. The anticode oligomers are useful for inhibiting growth of cancer cells or killing tumor cells. This polynucleotide sequence represents a bcl-2 oligodeoxynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for treating cancer in a leading the administration of anticode oligomers for treating to gene expressing cancer cells. The invention further comprises: a pharmaceutical composition comprising an anticode oligomer, and a
                                                                                                                                                                                                                                                                                                                                                  Brid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               thalassemia, parasite infections and viral (including retroviral) infections. The fatty acids capric and lauric acid (and their pharmaceutically acceptable salts) serve as penetration enhancers which facilitate the transport of the therapeutic nucleic acid across mucous membranes such as those of the alimentary canal, thereby increasing their alimentary bioavailability. The composition of the invention is therefore useful for the oral or rectal delivery of therapeutic nucleic acids such as antisense oligonuclectides which to date have required parenteral administration. The compositions therefore reduce the complications (e.g., the need for sterile procedures and partient hospitalization) and the concomitant expense associated with intravenous and other traumatic means of administering therapeutic nucleic acids. Sequences ADZ84098-ADZ8410 and ADZ84221 represent antisense oligonucleotides that modulate cellular proliferation which may be used in compositions of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADM36038 standard; DNA; 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid used in the composition of the invention is especially an antisense oligonucleotide which decreases the expression of a cellular adhesion protein or the rate of cellular proliferation, and preferably contains a 5-methyl-cytosine base or a 2'-methoxyethoxy (2'-MOE) sugar modification. Depending on the molecular target of the antisense oligonucleotide present in the composition, the compositions can be used for the treatment of cancers and tumors, Alzheimer's disease, beta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic

inflammatory cytokines such as TNP-alpha and interleukin-6 (IL-6), thus
reducing the induction of potential harmful side effects. The present
invention describes compositions that are useful for preparing a
pharmaceutical composition that can activate dendritic cells, B cells,
natural killer cells and hence treat an immune system deficiency.
Purthermore, they can be used to treat various diseases including
autoimmune disorders such as systemic lupus erythematosus (SLE) and
myasthenia gravis, immunodeficiency disorders such as AIDS, malignant
tumours that cause gastric and skin cancer as well as leukaemia and
lymphoma, and various infectious diseases for example from bacteria,
viruses and protozoa. Accordingly, such compositions exhibit
